

Dear Prime Minister, Mr John Key

I am not sure exactly how to explain this but I will try my best, well anyway. The way we're living now is causing the ozone to break away things like cars factories and rubbish and there's probably at least a hundred other things causing the ozone layer to break away. Unfortunately the hole in the ozone layer is right above us .It's not that hot around here, but the UV raise is stronger. This means we have more of a chance of cancer than anywhere else in the world.

If we don't stop the factories, cars and the other things right now, the hole in the ozone layer will get bigger and bigger until the earth blows up. This obviously means that we will die. If someone survives the explosion, there would be no water left, just acid water.

Acid water is caused by pollution, smoke and gases drift up to the clouds and when acid clouds rain we get acid water. Acid water is poisonous to us, plants and animals. Acid water is one of the reasons our wild life are becoming close to extinction.

If you know what oxygen is, you will probably know that trees make it, they inhale carbon dioxide then exhale oxygen.

But trees need proper water, fresh water to live and if trees are dying we won't get oxygen, and if we don't get oxygen, we'll die.

You might think you'll be dead by the time the earth might explode think of your children and their children. They may not see the world the way it is now. You can stop this problem, I hope you take this problem seriously. If you don't believe in global warming; I'll prove it, where does gases and smoke come from it comes from cars, pollution, what happens to smoke acid rain.

This is really truly serious. You don't have to give up your car, your fridge, your life to help the world stop this problem; there are other ways like getting someone to start a solar company maybe a solar airplane or boat company. Make stricter laws about littering, you could make people pay a 1000 dollar fine for throwing the thinnest piece of rubbish on the ground, or not using a solar car come on; you're the Prime Minister make really good use of it before its too late!

Yours sincerely

Dawn Parker
